Micromedics Introduces New Mixing Applicator Tips

St. Paul, Minnesota –December 31, 2008 - Micromedics, a privately-held manufacturer of medical devices, introduces three new FibriJet® Mixing Applicator Tips, the latest addition to the company's line of Blending and Mixing Applicator products for biomaterial application.

These Tips are a component of FibriJet® Applicator Assemblies, used in the precise delivery of biomaterials to treatment sites for surgery, including minimally-invasive procedures, and wound care. The new Mixing Applicators Tips are designed to actively mix two high or low viscosity biomaterials immediately before delivery to the treatment site. The materials are uniformly mixed in the Applicator Tip and dispensed to the treatment site as a single stream or spray. Used with FibriJet Applicators, these Mixing Applicators Tips offer convenient, one-handed operation for precise controlled delivery. The FibriJet system simplifies delivery and reduces costs by employing one delivery device instead of several devices for delivery of multiple materials.

Micromedics, Inc. was founded in 1982. The Company develops, manufactures and markets a number of proprietary devices for surgery including implants and instruments for ear, nose and throat surgery, trays for organizing and protecting surgical instruments during sterile reprocessing and applicators for dispensing biomaterials such as platelet gel and tissue sealants, a device for relieving negative ear pressure and ear protection and ear care products. The Company also serves as an outsource developer and manufacturer of products for other medical device companies. The Company markets its products and services through a worldwide network of independent representatives and stocking distributors. To learn more about Micromedics products, visit our website at www.micromedics.com or call us at 800-624-5662.
